# **Chapter 9: IP** Routing

Network & System Lab, NSYSU

### Introduction

☐ Our interest here: How a single IP layer makes its routing decisions

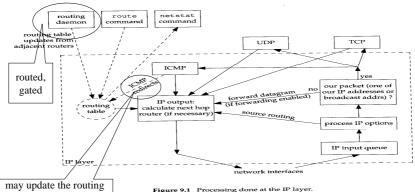

Figure 9.1 Processing done at the IP layer.

table Department of Contract Delicates and Contracting INFORMAL SIGN EAST-BOOK CONTRACTORS

# **Routing Principles**

- □ Routing table is accessed frequently by IP (hundreds of times a second) but is updated much less frequently by a routing daemon (once every 30 seconds).
  - Can be updated when ICMP "redirect" messages are received.
  - Updated by route command.
- □ A matching host address is always used before a matching network address: routing mechanism:
  - ❖ 1. Search for a matching host address.
  - 2. Search for a matching network address.
  - 3. Search for a default entry.

Network & System Lab, NSYSU

3

# **Simple Routing Table**

- netstat options:
  - -r option: list the routing table
  - ❖ -n option: print IP address in numeric format

```
    svr4 % netstat -rn

    Routing tables

    Destination
    Gateway
    Flags
    Refcnt Use
    Interface

    140.252.13.65
    140.252.13.35
    UGB
    0
    0
    end0

    127.0.0.1
    127.0.0.1
    UH
    1
    0
    100

    default
    140.252.13.33
    UG
    0
    0
    end0

    140.252.13.32
    140.252.13.34
    U
    4
    25043
    end0
```

# **Simple Routing Table (Cont.)**

- □ Flags:
  - U the route is up
  - ❖ G the route is gateway (router)
  - the route is to a host
  - the route was created by a redirect
  - the route was modified by a redirect

Network & System Lab. NSYSU

-

# **Simple Routing Table (Cont.)**

- □ The G Flag:
  - not set for a direct route, else for indirect route
- □ A packet goes out a direct route:
  - both the IP address and the link-layer address specifying the destination
- □ A packet goes out a indirect route:
  - the IP address specifies the final destination but the link-layer address specifies the gateway(the next-hop router)
- ☐ The H Flag:
  - set for a host address, searched first by the routing principle
- Reference count column gives the number of active uses for each route.

### **Simple Routing Table (Cont.)**

### ☐ The complexity of a routing table:

- simplest: not connected to the network: only a single entry for the loopback interface
- connected to a single LAN: only able to access hosts on that LAN: two entries, one for loopback, one for LAN
- other networks are reachable through a single router: normally handled with a default entry pointing to that router
- host-specific or network-specific routes are added

Network & System Lab. NSYSU

#### 7

# **Simple Routing Table (Cont.)**

### ☐ Illustration by a example (the host svr4):

- the destination is the host sun, 140.252.13.33 ... not match any host entry ... matches 140.252.13.32 (the network IDs and subnet IDs match) ... so emd0 interface is used
- the destination is the host slip, 140.252.13.65 ... matches the host entry ... and then indirect route
- the destination is the host aw.com (192.207.117.2) ... not match any host entry ... not match any network entry ... searched for a default route ... then indirect route to the gateway 140.252.13.33 using the interface emd0

### **Initializing a Routing Table**

- ☐ An interface initialized, then automatically create a direct route in the routing table
- ☐ Use route command to assign a route explicitly
- ☐ Run a routing daemon or use the newer router discovery protocol

Network & System Lab, NSYSU

#### 9

# **A More Complex Routing Table**

```
sun % ifconfig sl0
sl0: flags=1051<UP,POINTOPOINT,ROWNING>
inet 140.252.1.29 --> 140.252.1.183 netmask ffffff00
```

### No Route to Destination

### ☐ If there is NO default route:

- for the IP datagram was generated on the host: an error is returned to the application that sent the datagram, either "host unreachable" or "network unreachable"
- for the IP datagram is being forwarded: an ICMP host unreachable error is sent back to original sender.

Network & System Lab, NSYSU

11

### **ICMP Host and Network Unreachable Errors**

☐ The ICMP "host unreachable" error message is sent by a router when it receives an IP datagram that it cannot deliver or forward.

```
svr4 % ping gemini
ICMP Host Unreachable from gateway sun (140.252.13.33)
ICMP Host Unreachable from gateway sun (140.252.13.33)
?? type interrupt key to stop
```

Test how far to know the host is not connected to the Internet: in this case about 6 routers

```
sun % ping 192.82.148.1 this IP address is not connected to the Internet
PING 192.82.148.1: 56 data bytes
ICMP Host Unreachable from gateway enss142.UT.westnet.net (192.31.39.21)
for icmp from sun (140.252.1.29) to 192.82.148.1
```

### To Forward or Not to Forward

- ☐ Hosts are not supposed to forward IP datagrams unless they have been specifically configured as a router:
  - Most Berkeley-derived implementations have a kernel variable named *ipforwarding*, or some similar name.
  - Older 4.2 BSD hosts forwarded datagrams by default, which caused lots of problems for systems configured improperly. That's why this kernel option must always default to "never forward" unless the system administrator specifically enables forwarding.

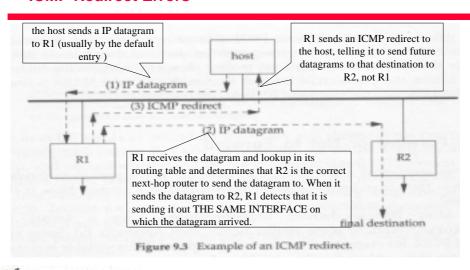

Network & System Lab, NSYSU

#### 1.3

### **ICMP Redirect Errors**

A BUT DIT BET GROWNSTT

# **ICMP Redirect Errors (Cont.)**

### ■ An Example:

Network & System Lab, NSYSU

4-

# **ICMP Redirect Errors (Cont.)**

```
solaris | netstat -rn
 Routing Table:
   Destination
                    Gateway
                                  Flags Ref Use
                                                    Interface
 127.0.0.1
                  127.0.0.1
                                            0
                                                848 100
140.252.13.35
                  140.252.1.183
                                   UGIO
                                            0
 140.252.1.0
                  140.252.1.32
                                             15045 le0
                                                 0 le0
 224.0.0.0
                 140.252.1.32
                                   U
                                               5749
                  140.252.1.4
                                   UG
 default
```

the route was installed by an ICMP redirect

# **ICMP Redirect Errors (Cont.)**

### □ ICMP redirect message:

IP header (including options)+first 8 bytes of original IP datagram data

 code
 Description

 0
 redirect for network

 1
 redirect for host

 2
 redirect for type-of-service and network

 3
 redirect for type-of-service and host

the rules about ICMP redirects:

- 1 generated only by routers, not by hosts
- 2 intended to be used by hosts, not routers
- 3 the routing protocol should obviate the need for redirects

Network & System Lab, NSYSU

17

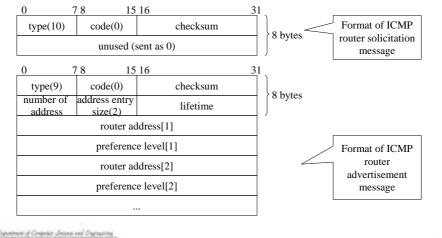

# **ICMP Router Discovery Messages**

- ☐ Initialize a routing table by using newer ICMP router advertisement and solicitation messages:
  - bootstrapping ... broadcast/multicast solicitation message ... one or more routers responds with a router advertisement message
  - Additionally, the routers periodically broadcast/multicast their router advertisements, allowing any hosts that are listening to update their routing table accordingly
  - ❖ RFC 1256 specifies the format of these two ICMP messages:

# **ICMP Router Discovery Messages**

### □ (continued...)

# **ICMP Router Discovery Messages (Cont.)**

### **□** Router Operation:

- When a router starts up, it transmits periodic advertisements on all interfaces capable of broadcasting or multicasting.
- These advertisements are not exactly periodic, but are randomized

### ■ Host Operations:

- Upon bootstrap, a host normally transmit three router solicitations, 3 seconds apart.
- ❖ A host also listens for advertisements from adjacent routers.

### **□** Implementation:

The router discovery message are normally generated by and processed by a user process (a daemon)

Network & System Lab. NSYSU

# **Summary**

- ☐ How a single IP layer makes its routing decisions
- □ Routing principles
- □ ICMP host and network unreachable errors
- □ ICMP redirect errors
- **□ ICMP Router Discovery Messages**

Network & System Lab, NSYSU
